

Research and Select the Appropriate Generative AI Model

This activity focuses on researching different Generative AI models and selecting the most suitable model for a specific application. It involves comparing models based on factors such as accuracy, performance, cost, scalability, response quality, security, and ease of integration. The research helps identify the strengths and limitations of available models and determine which one best meets the project's requirements. The selected model can then be used to develop an efficient and reliable Generative AI solution.
