

There are no details about the application's purpose, features, UI, backend, APIs, database, AI/LLM provider, authentication, or deployment configuration.

Please upload the actual project documentation (PDF/DOCX/README/screenshots/specification). Once provided, I can use it as the source and produce:

- Complete frontend
- Complete backend/API
- AI/LLM integration
- Database and schemas
- Authentication if required
- Project folder structure
- package.json / dependency files
- Environment configuration
- API routes and services
- UI components and pages
- Error handling and validation
- README with setup/run instructions
- Full source code for every required file
- Configuration for local development and deployment

If the documentation is split across multiple files, upload all of them together so I can build the project consistently.
